CLAIMS

What is claimed is:

1. A method of transmitting data across a high-speed serial bus, the method comprising:

in accordance with a first TX symbol clock:

generating a 10-bit symbol on an IEEE 1394-compliant PHY having a port interface;

placing the generated 10-bit symbol on the port interface;

scrambling the 10-bit symbol;

encoding the 10-bit symbol;

placing the 10-bit symbol in a FIFO;

in accordance with a second TX clock, the second TX clock running at a different speed than the first TX clock:

removing the 10-bit symbol from the FIFO;

deriving an 8-bit byte from the removed 10-bit symbol; and

sending the 8-bit byte to an IEEE 802.3-compliant PHY.

2. The method of claim 1, wherein a symbol is removed from the FIFO on four out of every five GMII TX clock cycles.

3. The method of claim 1, wherein a null 10-bit symbol is placed in the FIFO if there are no 10-bit symbols present in the FIFO.

4. The method of claim 1, wherein the 8-bit byte is derived from the 10-bit symbol by using 8 bits from the extracted 10-bit symbol, and the two remaining bits are stored.

5. The method of claim 4, wherein a second 8-bit byte is derived by extracting from the FIFO a second 10-bit symbol and assembling an 8-bit byte from the stored two bits and six bits from the extracted second 10-bit symbol; the four remaining bits from the extracted second symbol are stored; and the second 8-bit byte is sent to the IEEE 802.3-compliant PHY.

6. The method of claim 5, wherein a third 8-bit byte is derived by extracting from the FIFO a third 10-bit symbol and assembling an 8-bit byte from the four stored bits and four bits from the third extracted symbol; the six remaining bits from the extracted third symbol are stored; and the third 8-bit byte is sent to the IEEE 802.3-compliant PHY.

7. The method of claim 6, wherein a fourth 8-bit byte is derived by extracting from the FIFO a fourth 10-bit symbol, and assembling an 8-bit byte from the six stored bits and 2 bits from the extracted fourth 10-bit symbol; the eight remaining bits from the extracted fourth symbol are stored; and the fourth 8-bit byte is sent to the IEEE 802.3-compliant PHY.

8. The method of claim 7, wherein a fifth 8-bit byte is derived from the stored eight remaining bits and sent to the IEEE 802.3-compliant PHY.

9. The method of claim 1, further comprising, in accordance with a phase amplitude modulation clock, sending the received 8-bit byte from the IEEE 802.3-compliant PHY to a device in accordance with a phase amplitude modulation clock.

10. A method of transmitting data across a high-speed serial bus, the method comprising:

receiving an 8-bit byte;

in accordance with a GMII RX clock:

if the received 8-bit byte contains a null symbol, then deleting the null symbol;

else if the received 8-bit byte does not contain a null symbol, then storing the 8-bit byte in a first register;

receiving a second 8-bit byte that does not contain a null symbol and storing the second 8-bit byte in a second register;

assembling a 10-bit symbol from the 8-bit byte stored in the first register and appending two bits from the 8-bit byte stored in the second register; and

placing the assembled 10-bit symbol in a first FIFO;

in accordance with a second clock:

removing the 10-bit symbol from the first FIFO;

performing 8B10B and control decoding on the removed 10-bit symbol; and

placing the decoded 10-bit symbol in a second FIFO;

in accordance with a third clock:

removing the decoded 10-bit symbol from the second FIFO; and

sending the decoded 10-bit symbol to an IEEE 1394-compliant PHY.

11. The method of claim 10, wherein the second clock is phase locked to the third clock.

12. The method of claim 11, wherein frequency of null character deletion is used to control a phased locked loop, the phase locked loop associated with the second clock.

13. A method of transmitting data across a high-speed serial bus, the method comprising:

in accordance with a first TX symbol clock:

generating a 10-bit symbol on an IEEE 1394-compliant PHY having a port interface;

placing the generated 10-bit symbol on the port interface;

performing flagged encoding the 10-bit symbol;

placing the 10-bit symbol in a FIFO;

in accordance with a second TX clock, the second TX clock running at a different speed than the first TX clock:

removing the 10-bit symbol from the FIFO;

deriving an 8-bit byte from the removed 10-bit symbol; and

sending the 8-bit byte to an IEEE 802.3-compliant PHY.

14. The method of claim 13, wherein a symbol is removed from the FIFO on four out of every five GMII TX clock cycles.

15. The method of claim 13, wherein a null 10-bit symbol is placed in the FIFO if there are no 10-bit symbols present in the FIFO.

16. The method of claim 13, wherein the 8-bit byte is derived from the 10-bit symbol by using 8 bits from the extracted 10-bit symbol, and the two remaining bits are stored.

17. The method of claim 16, wherein a second 8-bit byte is derived by extracting from the FIFO a second 10-bit symbol and assembling an 8-bit byte from the stored two bits and six bits from the extracted second 10-bit symbol; the four remaining bits from the extracted second symbol are stored; and the second 8-bit byte is sent to the IEEE 802.3-compliant PHY.

18. The method of claim 17, wherein a third 8-bit byte is derived by extracting from the FIFO a third 10-bit symbol and assembling an 8-bit byte from the four stored bits and four bits from the third extracted symbol; the six remaining bits from the extracted third symbol are stored; and the third 8-bit byte is sent to the IEEE 802.3-compliant PHY.

19. The method of claim 18, wherein a fourth 8-bit byte is derived by extracting from the FIFO a fourth 10-bit symbol, and assembling an 8-bit byte from the six stored bits and 2 bits from the extracted fourth 10-bit symbol; the eight remaining bits from the extracted fourth symbol are stored; and the fourth 8-bit byte is sent to the IEEE 802.3-compliant PHY.

20. The method of claim 19, wherein a fifth 8-bit byte is derived from the stored eight remaining bits and sent to the IEEE 802.3-compliant PHY.

21. The method of claim 13, further comprising, in accordance with a phase amplitude modulation clock, sending the received 8-bit byte from the IEEE 802.3-compliant PHY to a device in accordance with a phase amplitude modulation clock.

22. A method of transmitting data across a high-speed serial bus, the method comprising:

receiving an 8-bit byte on an IEEE 802.3-compliant PHY;

in accordance with a GMII RX clock:

if the received 8-bit byte contains a null symbol, then deleting the null symbol;

else if the received 8-bit byte does not contain a null symbol, then storing the 8-bit byte in a first register;

receiving a second 8-bit byte that does not contain a null symbol and storing the second 8-bit byte in a second register;

assembling a 10-bit symbol from the 8-bit byte stored in the first register and appending two bits from the 8-bit byte stored in the second register;

performing flagged decoding on the assembled 10-bit symbol and

placing the assembled 10-bit symbol in a FIFO;

in accordance with a second clock:

removing the 10-bit symbol from the first FIFO; and

sending the decoded 10-bit symbol to an IEEE 1394-compliant PHY.

23. The method of claim 22, wherein a received data valid state is asserted on the IEEE 802.3-compliant PHY.

24. The method of claim 22, wherein the FIFO compensates for ppm differences between the IEEE 802.3-compliant PHY and the IEEE 1394-compliant PHY.

25. An apparatus for transmitting data across a high-speed serial bus, the apparatus comprising:

an IEEE 802.3-compliant PHY having a GMII interface;

an IEEE 1394-compliant PHY in communication with the IEEE 802.3-compliant PHY;

a first connection, the first connection for transmitting data between a device and the IEEE 802.3-compliant PHY; and

a second connection, the second connection for transmitting data between a device and the IEEE 1394-compliant PHY.

26. An apparatus for transmitting data across a high-speed serial bus, the apparatus comprising:

an IEEE 802.3-compliant PHY having a GMII interface;

an IEEE 1394-compliant PHY in communication with the IEEE 802.3-compliant PHY via a switch; the switch determining whether data transmission is be routed to the IEEE 802.3-compliant PHY or the IEEE 1394-compliant PHY;

a first connection, the first connection for transmitting data between a device and the IEEE 802.3-compliant PHY; and

a second connection, the second connection for transmitting data between a device and the IEEE 1394-compliant PHY.

27. The apparatus of claim 25, further comprising an autonegotiation mechanism, the autonegotiation mechanism determining whether data is to be routed between the IEEE 802.3-compliant PHY and the IEEE 1394-compliant PHY.

28. The apparatus of claim 26, wherein the autonegotiation mechanism determines whether data is to be routed through the IEEE 802.3-compliant PHY to the first connection.
